

Pediatric BLS (1 year of age to puberty) for Lay Rescuers

1. Call for Help

Act fast and get help.

- If the child or infant is unresponsive, shout for help.
- Call 911.
- Ask someone to get an AED.
- If the child or infant is not breathing normally, **immediately start CPR.**

2. Give Compressions and Breaths

Children and infants need compressions *and* breaths!

- Start CPR. Using the heel of 1 (infant) or 2 (child) hands to push hard and fast in the center of the chest.
- After 30 compressions, give 2 breaths.
- Continue giving 30 compressions and 2 breaths until the AED or medical help arrives.

3. Use the AED

When that AED arrives, use it immediately!

- Turn on the AED and follow the prompts.
- Use child or infant pads if available and if using adult pads, make sure the pads do not touch each other.
- Continue CPR and breaths until medical help arrives.
