Pediatric Basic Life Support Algorithm for Healthcare Providers—2 or More Rescuers for Suspected or Confirmed COVID-19

Text in cascading boxes describes the actions that 2 or more rescuers should perform in sequence during cardiac arrest of a pediatric patient with suspected or confirmed COVID-19. Arrows guide the rescuers from one box to the next as they perform the actions. Some boxes have multiple arrows that lead outward, each to a different pathway depending on the outcome of the most recent action taken. Pathways are hyperlinked.

Box 1

There is an icon in this box that signifies the use of personal protective equipment appropriate for an aerosol-generating procedure (AGP): respirator (eg, N95), along with gown, gloves, and eye protection.

Verify scene safety. Proceed to Box 2.

Box 2

- Check for responsiveness.
- Shout for nearby help.
- First rescuer remains with the child. Second rescuer activates the emergency response system and retrieves the AED and emergency equipment.

Proceed to Box 3.

Box 3

Look for no breathing or only gasping and check pulse (simultaneously). Is pulse **definitely** felt within 10 seconds? If there is normal breathing and a pulse is felt, proceed to Box 3a.

If there is no normal breathing but a pulse is felt, proceed to Box 3b.

If there is no breathing or there is only gasping and no pulse is felt, proceed to <u>Box 5</u>.

Box 3a

Monitor until emergency responders arrive.

Box 3b

There is an icon in this box that signifies the use of a high-efficiency particulate air (HEPA) filter.

- Provide rescue breathing, 1 breath every 2 to 3 seconds, or about 20 to 30 breaths per minute using a HEPA filter with bag-mask ventilation. (This step includes suspected AGP, on the basis of current studies.)
- Assess pulse rate for no more than 10 seconds.

Proceed to Box 4.

Box 4

Is heart rate less than 60 per minute with signs of poor perfusion?

If Yes, proceed to Box 4a.

If No, proceed to Box 4b.

Box 4a

Start CPR.

Box 4b

- Continue rescue breathing; check pulse about every 2 minutes.
- If no pulse, start CPR.

Box 5

Start CPR

There is an icon in this box that signifies the use of a HEPA filter.

• First rescuer performs cycles of 30 compressions and 2 breaths. (This step includes suspected AGP, on the basis of current studies.)

- When second rescuer returns, perform cycles of 15 compressions and 2 breaths.
- Use the AED as soon as it is available.

Proceed to <u>Box 6</u>.

Box 6

Check rhythm. Is it a shockable rhythm? If Yes, it is shockable, proceed to $\frac{\text{Box } 7}{\text{No}}$. If No, it is nonshockable, proceed to $\frac{\text{Box } 8}{\text{No}}$.

Box 7

- Give 1 shock. (This step includes suspected AGP, on the basis of current studies.) Resume CPR immediately for 2 minutes (until prompted by the AED to allow a rhythm check).
- Continue until advanced life support providers take over or the child starts to move. Return to Box 6, if necessary.

Box 8

- Resume CPR immediately for 2 minutes (until prompted by the AED to allow a rhythm check).
- Continue until advanced life support providers take over or the child starts to move. Return to <u>Box 6</u>, if necessary.
